Published Application(s):

Tested Applications(s):

Activity: Herpesvirus entry mediator (HVEM) is a member of the TNF-receptor superfamily, identified as a cellular mediator of herpes simplex virus (HSV) entry, where it binds HSV viral envelope glycoprotein D during viral entry. The cytoplasmic region of this protein binds to several TRAF members, perhaps mediating signal transduction pathways to activate an immune response [NCBI Entrez Gene Entry]. In melanocytic cells TNFRSF14 gene expression may be regulated by MITF [PMID: 19067971] and has been recurrently associated with diffuse large B-cell lymphoma [PMID: 21796119, 22343534].
